

## Are you ready for summer's high temperatures and electrical storms?

The summer months have arrived and already the country has seen intense and in some cases violent storm systems. Lightning and quickly moving power surges can instantly bring down sensitive electronic systems in any business. This often happens without warning – day or night. Even the magnetic field that is part of a lightning strike can inflict damage on nearby computers and electronics. And with a powerful strike, damage to computer networks, automated machinery, computer drives & controls, and diagnostic equipment could shut down a plant leading to costly business interruptions and lost production time.

Types of damage from lightning can include blown fuses, flashover of insulation inside motors or transformers, vaporized transistors and integrated circuits, vaporized traces on printed circuit boards, and other damage that places business on hold for an indeterminate amount of time. Minimize downtime by making sure you're prepared. If electronic equipment seems to have suffered some type of damage after an electrical storm, repair of the impacted equipment can be quickly accomplished by sending the damaged items to Schneider Electric Industrial Repair Services. We have broad industrial electronic repair capabilities along with over 40 years of extensive repair experience. Schneider Electric Industrial repair also stocks top-selling brands of Remanufactured industrial electronics, including many obsolete products.
